Library Book Management System

Database Requirements Project

Part 1: Database Use Case

This project focuses on managing books in a college library. Students sometimes have trouble finding the books they need or checking if a book is available. Library staff also need to keep track of books and update their information when books are borrowed or returned.

A database could make this process easier by keeping all book information in one place. Students could search for books by title, author, or category and check their availability. Library staff could also update book records and keep track of borrowed and returned books. This would be more convenient than using paper records or separate spreadsheets. The system would help students find books more easily and allow library staff to manage the library more efficiently.

Part 2: Stakeholder Analysis

Who are they?	What information do they need?	What actions do they need to perform?
Students	Book titles, authors, categories/genres, ISBNS and availability, return dates, release year, book format (ebook, physical book, etc)	Search for books and check whether books are available
Librarians	Book information, borrowing status, and return dates	Add new books, update book information, and track borrowed and returned books

Library Managers	Information about the book collection and borrowing activity, copies available	Monitor library operations and identify which books are frequently borrowed

Part 3: Success Criteria

The database will be successful if students can easily search for books and check their availability before visiting the library. This allows them to know whether the books they need are available before making a trip to the library, saving time and making the borrowing process more convenient. Library staff should be able to update book information and keep track of borrowed and returned books. The information should be accurate, organized, and easy to access. Overall, the system should make it easier for students to find books and help library staff manage the library more efficiently.
